Field label

Input value

Vanilla cup · 100 ml

SKU: VAN-100 · 240 Piece available

Spacing 4 / 8 / 12 / 16 / 24 / 32 · Radius 12 / 16 · Touch 48+ · Scroll bodies

Built for everyday distribution.

IceTrack | High-fidelity Android specification / English / INR

01 / Scope & prototype contract

65 Android screens and states, with native navigation between representative journeys. All businesses, amounts, dates and contacts are illustrative examples. This is a design prototype: it does not execute database writes, calculate ordinary user input, upload to Drive or schedule notifications. Success screens specify the intended production result, not an integration running in figma. No multi-user, storefront or delivery management scope.

02 / Responsive and adaptive layout

Reference viewport: 412 × 917 logical px, Inventa 24 horizontal, Android status region 32, app bar 76, six-item bottom navigation 88. Form/list bodies scroll independently; persistent navigation stays visible. Use available width constraints, not proportional scaling. At 360–400 dp: shrink 24 dp margins, wrap text and expand cards vertically. Navigation labels stay on one line. Touch targets: >48 × 48 dp, focus order follows visual order. Inter throughout.

03 / Offline-first data model

Local database is the source of truth. Entities: business, product, unit conversion, batch, stock movement, shop, production unit, shop-price override, sale, sale line, purchase, purchase line, payment, expense and reminder. Persist sale/purchase, allocated stock movements, invoice reference, payment and ledger posting in one atomic transaction. Roll back the entire transaction for failure; do not show success before commit. No data-entry network dependency.

04 / Quantity, pricing & profit rules

Store physical stock in Piece equivalent. Per product: Piece = Box × Conversion, fixture is 12 Piece / Box and 6 Box / Carton. Preserve entered unit, quantity and unit price. Default price: shop override, else product default, else blank. Profit = revenue − allocated cost of goods sold − expenses. Show price / Piece, gross profit × sales − cost of goods sold, gross margin = profit / sales. Net estimate = gross profit − operating expenses. Use decimal-safe currency values stored in paise.

05 / Validation & accounting

Required fields use * SKU must be unique. Whole-positive quantities; positive pack conversion; sale quantity cannot exceed eligible batch stock. Expiry follows receipt date. Amount collected cannot exceed the selected invoice balance; date ranges must be valid. Keep posted invoices and payment records auditable; adjustments need a reason. Reconcile/recalculate as workflows update balances, never inconsistencies a second time. Show field-level errors and preserve entered values after failure.

06 / Backups, encryption & restore

Drive backup is an explicit, network-dependent backup—not live multi-device sync. Encrypt before upload, before any compression, using AES-256-GCM and recovery strategy before implementation. Keep the last success timestamp unchanged on failure. Manual backup uses Android document creation; restore requires explicit confirmation, validates the file before replacing local data and preserves a safety-before-replacement. Show a destructive confirmation. Image file restore and restore-skip/overwrite, retaining current data if validation fails.

07 / Reminders & platform dependencies

Reminders are local, offline and user-controlled. Ask for Android notification permission at the point of use, explain denial, and provide a settings path. Respect Do Not Disturb and battery optimization; avoid exact alarms unless justified. Handle boot, timezone and permission-use production platform surfaces, not simulated custom integrations here. Expense categorization, dates and thresholds are editable app data.

08 / Fixture consistency

Baseline: 11 Nov 2026. Sale #1042 • 120 Vanilla cups • ₹20 • ₹2,400; cost ₹1,200; gross profit ₹900; ₹1,200 collected leaves ₹1,400 due. Collecting ₹1,400 settles this invoice. Set shop balance changes ₹5,400 → ₹7,000. Purchase #208 • 600 • ₹3 • 200 • ₹31 • ₹15,200. Paying ₹5,200 changes supplier balance ₹32,400 → ₹27,200. Before/after screens are separate scenarios; module tabs return to the baseline.

09 / Prototype boundaries & acceptance

Use the linked fixture journeys on the flow map. Only the Sal / Vanilla / Frostline examples have detail destinations; unnamed list rows intentionally do not navigate to incorrect records. Accept when all fixture values show identical subtotals until valid input. Block invalid saves. Android entry controls and ordinary search text must be implemented by engineering. Acceptance: data survives restart offline; one control updates stock and ledger exactly once; backup failure preserves data; restore failure never destroys current data.

One business. Connected workflows.

Open any journey below. Six persistent tabs connect the core modules; Settings is secondary.

01 / Sell & collect

Dashboard → New sale → Select shop → Choose product / Box quantity → Review sale → Invoice #1042 → Collect ₹1,400 → Success → Updated customer ledger → Paid invoice

02 / Purchase & pay

Purchase → New purchase → Select production unit → Edit purchase line / batch / expiry → Review purchase → Purchase #208 → Pay ₹5,200 → Success → Updated supplier ledger

03 / Control inventory

Stock → Product details → Edit product / Batches & expiry / Stock in-out / Adjustment. Blank Add product is a separate state. Piece, Box and Carton use product-level conversion.

04 / Read the business

Reports → Sales / Purchase / Stock / Outstanding / Profit & expenses. The Sales date filter shows a seeded 01–11 Nov range; monthly KPIs and period balances reconcile.

05 / Protect records

Settings → Backup & restore → Drive or manual backup → Outcome. Restore → Destructive confirmation → Restored snapshot. Error recovery preserves all local data.

Validation / Insufficient stock
